INFORMATICS STUDY PROGRAM FACULTY OF COMMUNICATION AND INFORMATION SCIENCE MUHAMMADIYAH SURAKARTA UNIVERSITY

PRACTICE

1)Frames

Things related to building a JFrame are: The frame title is created by running the constructor on the JFrame using the command super("Frame Title"). The size of the frame is set by the setSize() method. When the frame is closed and the Java application will also be closed/stopped, you can use the setDefaultCloseOperation() method. In order for the frame to be displayed on the computer screen (output), it is necessary to set the setVisible() method with the parameter TRUE. Implementation of frames can be seen in Program 1 below.

```
public class Utama extends javax.swing.JFrame{
2
        public Utama() {
3
            super ("Belajar mengenal GUI");
4
            setSize(300,100);
5
            setDefaultCloseOperation(EXIT_ON_CLOSE);
6
            setVisible(true);
7
            setLocationRelativeTo(null);
8
        }
9
        public static void main(String[] args)
10
            Utama u = new Utama();
11
12
    }
```

Program 1. Implementasi JFrame

Code program:

```
12

    ☐ import java.awt.*;

     import javax.swing.*;
15
16
      public class Utama extends javax.swing.JFrame {
17 🗐
          public Utama() {
             super ("Belajar mengenal GUI");
18
19
              setSize(300, 100);
              setDefaultCloseOperation(EXIT ON CLOSE);
20
21
              setVisible(true);
              setLocationRelativeTo(null);
22
23
24 🖃
          public static void main(String[] args) {
              Utama u = new Utama();
25
26
27
```

Complete the understanding of the implementation of the JFrame class in the following table:

Konstruktor	Keterangan
JFrame()	Mengkonstruksi frame baru yang pada awalnya tidak tampak (invisible)
JFrame(String Judul)	Mengkonstruksi frame baru yang pada awalnya tidak tampakdengan title yang telah ditentukan

Metode	Keterangan
<pre>void setSize(int lebar, int tinggi)</pre>	Menentukan ukuran frame lebar dan tinggi
<pre>void setLocation(int x, int y)</pre>	Menentukan posisiatau letak frame
void setVisible(Boolean)	Menentukan apakah frame ditampilkan atau tidak
setLocationRelativeTo(Component)	Mengatur lokasi komponen yang spesifik, apabila komponennya null maka frame akan tepat ditengah layar

2) Button

Program 2 is code to display buttons of a certain size. this button placed in the class FrameA which inherits from Jframe.

```
import java.awt.Container;
  import javax.swing.JButton;
3 public class FrameA extends javax.swing.JFrame{
4
       public FrameA() {
          super ("Frme dan Button");
           setSize(100, 50);
7
           setDefaultCloseOperation(EXIT_ON_CLOSE);
8
           setVisible(true);
9
           setLocationRelativeTo(null);
10
11
       public static void main(String[] args) {
12
          FrameA fa = new FrameA();
13
           Container kontainer =
   fa.getContentPane();
14
           JButton jbtOK = new JButton("OK");
15
           kontainer.add(jbtOK);
16
       }
17 }
```

Program 2. Implementasi JButton

Code Program:

```
13 🗏 import java.awt.Container;
    import javax.swing.JButton;
14
15
     public class FrameA extends javax.swing.JFrame {
16
17 豆
          public FrameA(){
             super ("Frame dan Button");
18
19
             setSize(100, 50);
20
             setDefaultCloseOperation(EXIT ON CLOSE);
21
             setVisible(true);
22
             setLocationRelativeTo(null);
23
24 🗐
          public static void main (String[] args) {
25
             FrameA fa = new FrameA();
             Container kontainer = fa.getContentPane();
26
27
             JButton jbtOK = new JButton ("OK");
28
              kontainer.add(jbtOK);
29
30
     }
31
```

b) Complete the understanding of JButton implementation in the following table:

Konstruktor	Keterangan
JButton()	Membuat JButton tanpa label atau ikon apapun.
JButton(String teks)	Membuat JButton dan menetapkan teks tertentu sebagai labelnya.
JButton(Icon icon)	Membuat JButton dengan ikon dan tanpa label.
JButton(String teks, Icon icon)	Membuat JButton dengan label dan ikon tertentu.

3) Containers

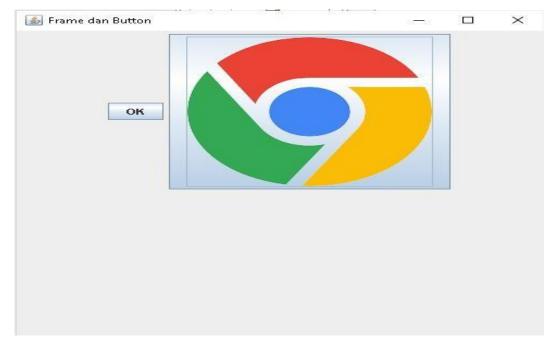

The JFrame can be loaded with GUI components after placing the container. Containers are special components that are useful for holding other GUI components. Here's an example of two buttons with a JPanel container. The second button uses an icon image. Please prepare the image first and place it in the same folder as the Java file (FrameB.java) that is being compiled and try programming as in Program 3 below.

```
import java.net.URL;
   import javax.swing.ImageIcon;
   import javax.swing.JButton;
   import javax.swing.JPanel;
   public class FrameB extends javax.swing.JFrame{
      public FrameB(){
           super("Frame dan Button");
           setSize(500,500);
           setDefaultCloseOperation(EXIT_ON_CLOSE);
10
           setLocationRelativeTo(null);
11
       }
       public static void main(String[] args) {
13
           FrameB fb = new FrameB();
14
           JPanel panel = new JPanel();
15
           URL img =
16 FrameB.class.getResource("shakehand2.png");
           JButton jbtOK = new JButton("OK");
17
           JButton jbtImg = new JButton(new
18
   ImageIcon(img));
19
          panel.add(jbtOK);
20
           panel.add(jbtImg);
21
           fb.add(panel);
22
           fb.setVisible(true);
23
24 }
```

Program 3. Implementasi container

Code Program:

```
12
13
   import java.net.URL;
14
      import javax.swing.ImageIcon;
15
      import javax.swing.JButton;
16
    import javax.swing.JPanel;
17
      public class FrameB extends javax.swing.JFrame 🕻
18
19
          public FrameB() {
20
              super ("Frame dan Button");
21
              setSize(500,500);
              setDefaultCloseOperation(EXIT_ON_CLOSE);
22
23
              setLocationRelativeTo(null);
24
25
          public static void main(String[] args) {
              FrameB fb = new FrameB();
26
27
              JPanel panel = new JPanel();
              URL img = FrameB.class.getResource("icons.png");
28
29
              JButton jbtOK = new JButton("OK");
              JButton jbtImg = new JButton(new ImageIcon(img));
30
31
              panel.add(jbtOK);
32
              panel.add(jbtImg);
33
              fb.add(panel);
              fb.setVisible(true);
34
35
36
37
```

4) Labels

Labels are graphic components made to contain text or icons. Program 4 is the implementation of JLabel using the Main class which was tried before in Program 4.

```
public class DemoLabel {
2
      public static void main(String[] args) {
           Utama u = new Utama();
3
           u.setSize(500,500);
           URL img = FrameB.class.
  getResource("shakehand.png");
          ImageIcon ikon = new ImageIcon(img);
7
           JLabel label = new JLabel("Label", ikon,
   SwingConstants.CENTER);
          JPanel panel = new JPanel();
9
           panel.add(label);
10
           u.add(panel);
11
12 }
              Program 4. Implementasi JLabel
```

Code Program:

```
12 | import java.net.URL;
13
   import javax.swing.*;
14
     public class DemoLabel (
15
16 🗇
         public static void main (String[] args) {
17
              Utama u = new Utama();
18
              u.setSize(500, 500);
              URL img = FrameB.class.getResource("icons.png");
19
20
              ImageIcon ikon = new ImageIcon(img);
              JLabel label = new JLabel("Label", ikon, SwingConstants.CENTER);
21
22
              JPanel panel = new JPanel();
23
              panel.add(label);
24
              u.add(panel);
25
26
```

B) Complete the understanding of the implementation of the JLabel class in the following table

Konstruktor	Keterangan
JLabel(String teks)	Mengkonstruksi obyek label dengan teks.
JLabel(String teks, int i)	Mengkonstruksi obyek label dengan teks serta menentukan baris secara horizontal.
JLabel(String teks, Icon ic, int i)	Mengkonstruksi obyek label dengan teks dan ikon serta menentukan baris secara

horizontal.

5) TextField and Password Field

JTextField is a GUI component that can accommodate text typed by program users. JPasswordField is used to hold input but the contents of the text are hidden. Program 5 is the code for implementing both.

```
import javax.swing.JLabel;
2 import javax.swing.JPanel;
3 import javax.swing.JPasswordField;
4 import javax.swing.JTextField;
5 public class DemoTextField {
      public static void main(String[] args) {
           Utama u = new Utama();
           JLabel nama = new JLabel("Nama : ");
9
           JLabel password = new JLabel("Password :
   ");
10
           JTextField inputNama = new
   JTextField(15);
11
           JPasswordField inputpsw = new
   JPasswordField(15);
13
          JPanel panel = new JPanel();
          panel.add(nama);
15
          panel.add(inputNama);
           panel.add(password);
17
           panel.add(inputpsw);
18
           u.add(panel);
19
20
21 }
```

Program 5. Implementasi JTextField dan JPasswordField

Code Program:

```
12
13 🗐 import javax.swing.JLabel;
     import javax.swing.JPanel;
14
15
     import javax.swing.JPasswordField;
   import javax.swing.JTextField;
16
17
18
     public class DemoTextField {
19
         public static void main(String[] args) {
20
              Utama u = new Utama();
21
              JLabel nama = new JLabel("Nama : ");
              JLabel password = new JLabel("Password : ");
22
23
              JTextField inputNama = new JTextField(15);
24
              JPasswordField inputpsw = new JPasswordField(15);
              JPanel panel = new JPanel();
25
26
              panel.add(nama);
27
              panel.add(inputNama);
              panel.add(password);
28
29
              panel.add(inputpsw);
30
              u.add(panel);
31
32
33
```

Output:

b) Complete the understanding of the implementation of the JTextField class in the following table:

Konstruktor	Keterangan
JTextField()	Mengkonstruksi obyek dengan teks kosong.
JTextField(int i)	Mengkonstruksi obyek dengan teks kosong dan jumlah kolom ditentukan oleh parameter columns.
JTextField(String i)	Mengkonstruksi obyek dengan teks ditentukan oleh nilai parameter text.
<pre>JTextField(String teks, int i)</pre>	Mengkonstruksi obyek dengan teks ditentukan oleh nilai parameter text dan jumlah kolom oleh nilai parameter columns.

Konstruktor	Keterangan
JTextField()	Mengkonstruksi obyek dengan teks kosong.
JTextField(int i)	Mengkonstruksi obyek dengan teks kosong dan jumlah kolom ditentukan oleh parameter columns.
JTextField(String i)	Mengkonstruksi obyek dengan teks ditentukan oleh nilai parameter text.
<pre>JTextField(String teks, int i)</pre>	Mengkonstruksi obyek dengan teks ditentukan oleh nilai parameter text dan jumlah kolom oleh nilai parameter columns.

6). Radio Buttons and Check Boxes

JRadioButton is used to make one selection out of the many available options. JCheckBox is used to make multiple selections at once. JRadioButton has a constructor similar to JCheckBox. Program 6 is an implementation of using the JRadioButton GUI component.

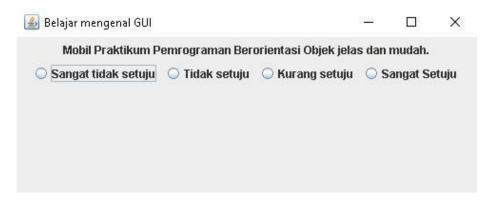

```
public class DemRadioButton {
2
       public static void main(String[] args) {
3
           Utama u = new Utama();
4
           u.setSize(1000, 100);
5
6
           JRadioButton[] teams = new
   JRadioButton[4];
7
          teams [0] = new JRadioButton("Sangat
   tidak setuju");
8
           teams [1] = new JRadioButton("Tidak
   setuju");
9
           teams [2] = new JRadioButton("Kurang
   setuju");
10
           teams [3] = new JRadioButton("Setuju",
11
           teams [3] = new JRadioButton("Sangat
   Setuju");
12
13
           JPanel panel = new JPanel();
           JLabel Pernyataan = new JLabel ("Modul
   Praktikum Pemrograman Berorientasi Objek jelas
   dan mudah.");
15
          panel.add(Pernyataan);
16
17
           ButtonGroup group = new ButtonGroup();
18
           for(int i = 0; i<teams.length; i++){</pre>
19
               group.add(teams[i]);
               panel.add(teams[i]);
21
22
23
           u.add(panel);
24
           u.setVisible(true);
26 }
```

Program 6. Implementasi JRadioButton

Code Program:

```
12
13 ⊡ import javax.swing.*;
14
     public class DemoRadio {
         public static void main(String[] args) {
16
             Utama u = new Utama();
17
             u.setSize(1000, 100);
18
19
             JRadioButton[] teams = new JRadioButton[4];
20
21
              teams [0] = new JRadioButton("Sangat tidak setuju");
22
              teams [1] = new JRadioButton("Tidak setuju");
23
              teams [2] = new JRadioButton("Kurang setuju");
              teams [3] = new JRadioButton("Setuju", true);
24
              teams [3] = new JRadioButton("Sangat Setuju");
25
26
27
              JPanel panel = new JPanel();
              JLabel Pernyataan = new JLabel("Mobil Praktikum Pemrograman "
28
29
                      + "Berorientasi Objek jelas dan mudah.");
30
              panel.add(Pernyataan);
31
32
              ButtonGroup group = new ButtonGroup();
              for(int i = 0; i < teams.length; i++){</pre>
9
34
                  group.add(teams[i]);
35
                  panel.add(teams[i]);
36
37
              u.add(panel);
38
              u.setVisible(true);
39
40
41
```

Output:

b) Complete the understanding of the implementation of the JCheckBox class in the following table:

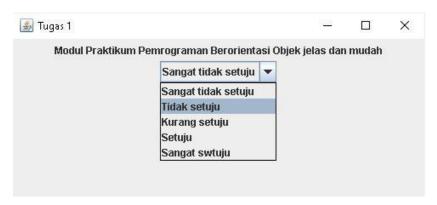

Konstruktor	Keterangan
JCheckBox(String teks)	Mengkonstruksi obyek check box dengan text.
JCheckBox(String, Boolean)	Mengkonstruksi obyek check box dengan text serta menentukan apakah check box dalam kondisi dipilih atau tidak.
JCheckBox (icon)	Mengkonstruksi obyek check box dengan ikon.
JCheckBox(icon, Boolean)	Mengkonstruksi obyek check box dengan ikon serta menentukan apakah check box dalam kondisi dipilih atau tidak.
JCheckBox(String, Icon)	Mengkonstruksi obyek check box dengan text dan ikon.

JCheckBox(String, Icon, Boolean) Mengkonstruksi obyek check box dengan text dan ikon serta menentukan apakah check box dalam kondisi dipilih atau tidak.

TASK:

1. Code Program:

```
Q
      import java.awt.*;
15
      import javax.swing. *;
16
17
      public class JComb extends javax.swing.JFrame {
18 📮
          public JComb(){
              super ("Tugas 1");
19
20
              setSize(600, 100);
21
             setDefaultCloseOperation(EXIT_ON_CLOSE);
22
              setVisible(true);
23
              setLocationRelativeTo(null);
24
25
26 🖃
          public static void main(String[] args) {
27
              JComb jc = new JComb();
28
29
              JPanel panel = new JPanel();
30
              JLabel pernyataan = new JLabel("Modul Praktikum Pemrograman Berorientasi"
31
                     + "Objek jelas dan mudah");
              panel.add(pernyataan);
32
33
              jc.add(panel);
34
35
              String[] pilihan = new String[]{"Sangat tidak setuju", "Tidak setuju",
36
              "Kurang setuju" , "Setuju" , "Sangat swtuju");
              JComboBox<String> jenisPilihan = new JComboBox<>(pilihan);
37
38
              panel.add(jenisPilihan);
39
40
41
42
```
